

General Assembly - Front End Web Development | Final Project

# Pinterest Buy Button Website Prototype

# Use code to build more functional prototypes and better communicate with developers.

## Design

Uncover a real world problem found on a widely used website. Quickly design a high level UX solution for the purposes of building a working prototype.

## Prototype

Create a low fidelity prototype to put in front of users for testing. The prototype will be made with InVision to study transitions and interaction. Monochrome wireframes will be made in Sketch so users may focus on the core UX.

## Code

Build a high fidelity prototype using HTML, CSS, JavaScript and JQuery. Recreate focused sections of the website by building pages from scratch. Build new pages, styles and behaviour based on new design. Use web development best practices when coding.

“I can buy pins on my phone but spend most of my time on the (Pinterest) website.”

Pinterest’s e-commerce efforts are currently a mobile feature only. This project will explore what the shopping and checkout experience might look like on the Pinterest website.

# Don't annoy users!

To avoid home page clutter, make the buy button visible only by hovering on the pin

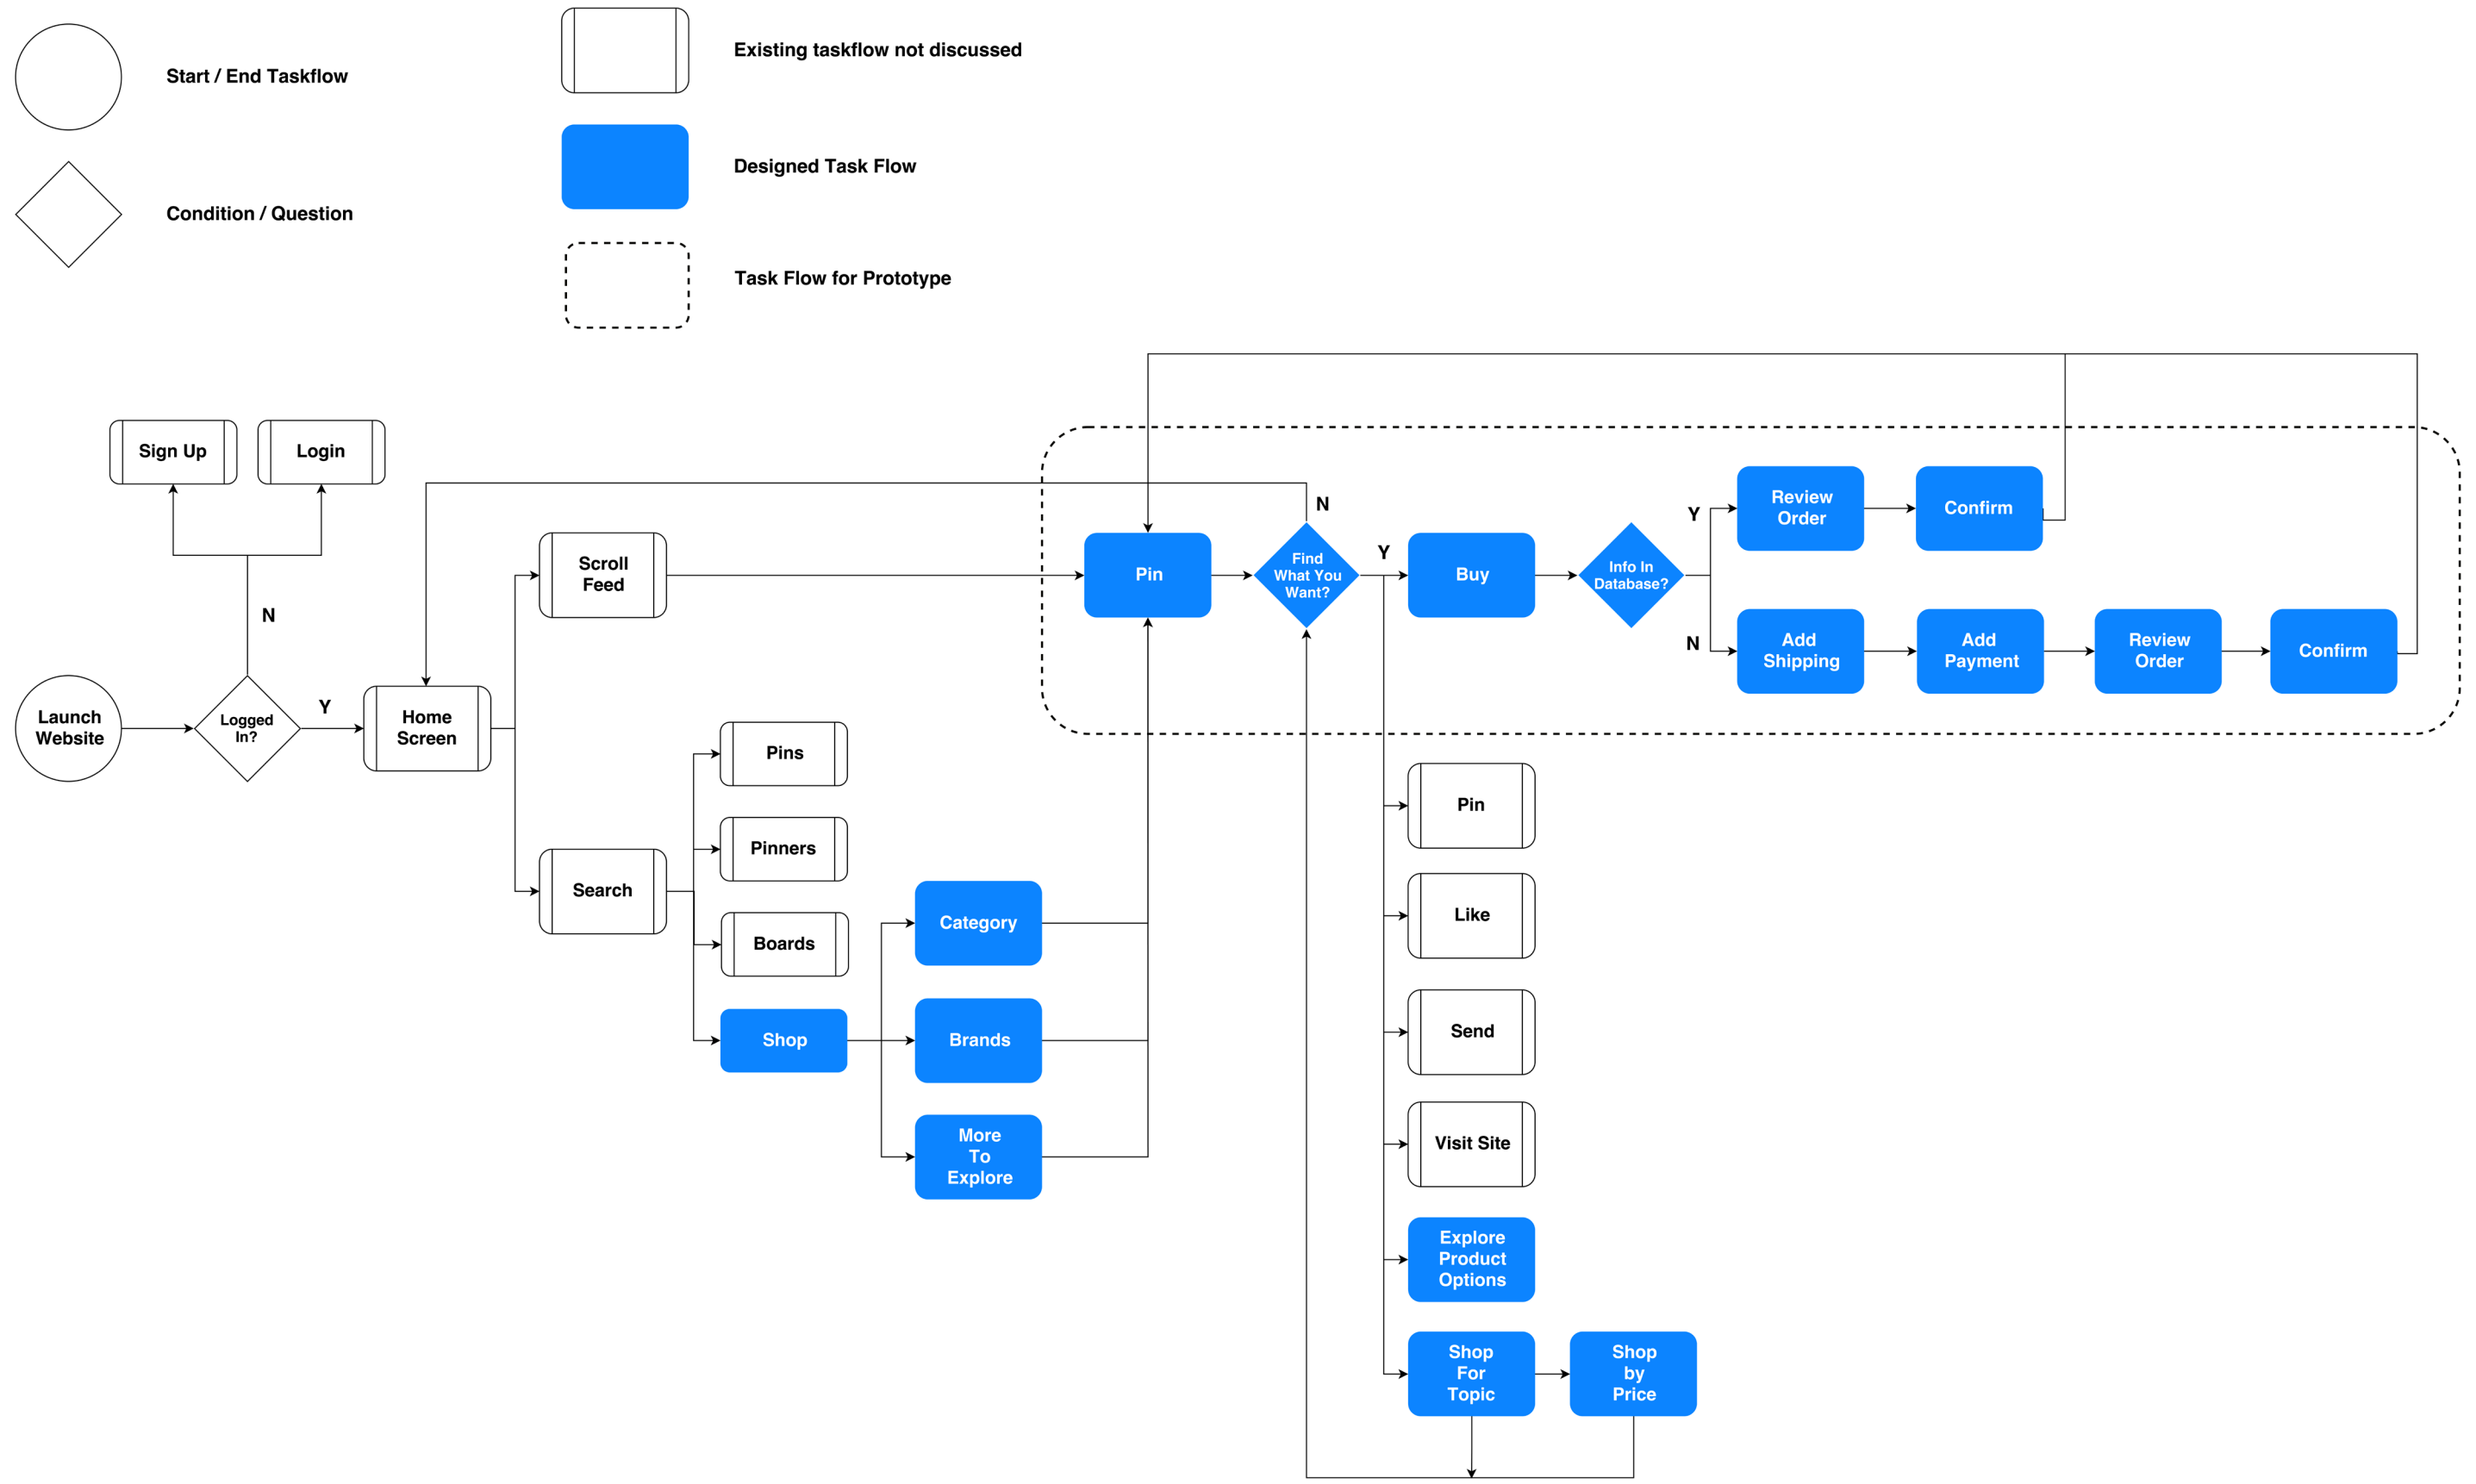

Make checkout experience as easy as possible with a one page layout and one click “place order” option if info is stored on the database

Make the checkout UI easy to read by using top aligned infield form labels
